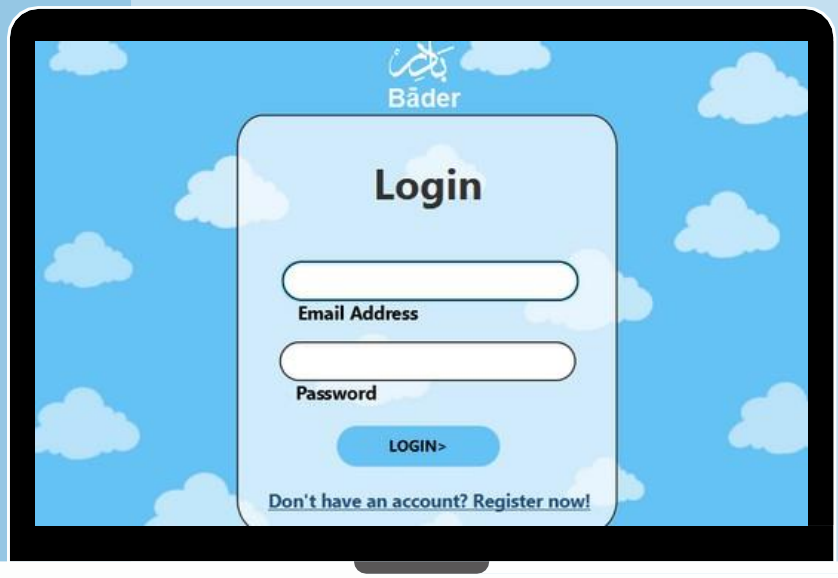
About Bāder

Bāder (بـادر) means "to initiate," reflecting the spirit of volunteering—individuals taking initiative to create positive change by offering their time and skills. The desktop system will enable volunteers to browse opportunities and apply for services, such as those in nursing homes. A gamification element is also included to motivate and encourage volunteer participation.

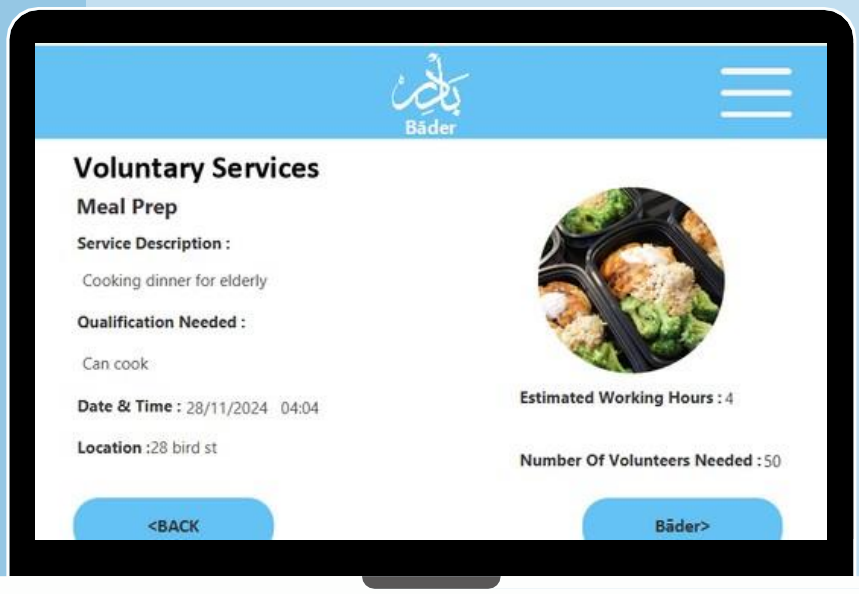


Main Functionalties

- Apply For A Voluntary Service
- Volunteer Profile and XP
- Story Chapter Unlock

Apply For A Voluntary Service

After browsing available voluntary services. The volunteer will press Bāder to apply for a voluntary service. In which the admin will accept or reject the voluntary service



Unlock Story Stages

After completing voluntary services, admin will rate the volunteer and the volunteer will get XP. When getting a certain number of XP it will unlock story chapters that the volunteer can read.

View Profile & XP

Volunteers can view their profile to track their XP, level, and title, which progresses through the angel hierarchy. As they earn more XP, they advance through ranks like “Angel” up to the highest, "Seraphim." This system rewards and motivates their ongoing contributions.

Implementation Tools

GIMP was used to change the icon colors and remove backgrounds where necessary .

Coded in **JAVA** & implemented in **intelliJ.**

SceneBuilder for GUIs since the built-in scenebuilder is slow.

Microsoft Access was used to implement our database

Reflection

What Worked

The project was a valuable learning experience, marking our first fully functioning system and guiding us through each stage—from planning to design and implementation. It taught us to overcome challenges with flexibility and to think creatively in finding solutions.

What Didn't Work

Initially, we attempted to use SQL Server as our database, but its complexity led us to pivot to a more manageable option. Similarly, GitHub proved challenging to learn, preventing us from fully utilizing it for version control.

Reflection

Team Selection

Pick your sibling! If you have no sibling doing the module, pick someone who is reliable and has almost the same habits as you. E.g., if you are time managed, pick someone who is also time managed.

*ChatGPT is your "behind the scenes" teammate, but you need to know what you're doing while using it.

Reflection

Project Selection

Pick a unique project. But also know your limits and work with a platform or language you are comfortable with. Rather have a functioning system than a fancy non-functioning system.

Reflection

Problem resolution

Agree on certain values & expectations before you start working.

If you face a problem talk about it openly & try to reach common ground.

If all fails draw your gun. Just kidding, talk to your supervisor they really know how to solve problems.

Initiate The Change!
